                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAQ80296 shows the cDNA encoding human Factor VII. Factor VII is a trace plasma glycoprotein that circulates in blood as a single-chain zymogen. The zymogen is catalytically inactive, and is converted into a two-chain active mol. by cleavage of an internal peptide bond located approx. In the middle of the mol. Factor VII a rapidly activates Factor X or Factor IX by limited proteolysis. Modified Factor VII has anticoaqulant properties, for preventing the coagulation cascade. The modified Factor VII has an active site modified by at least one amino acid substitution, and in its modified form is capable of binding tissue factor and inhibiting its action. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence is that encoding a Ser344Ala modified factor VII which can be used as part of a method for inhibiting thrombus formation. The method is used to maintain or improve vascular patency, to prevent or minimise myocardial injury associated with post-ischaemic reperfusion and to improve regional myocardial blood flow during post-ischaemic reperfusion. The method is particularly used where the site of thrombus or reduced patency is associated with (micro) surgery, angioplasty or trauma or where the myocardial injury is myocardial necrosis. Particular applications are in treatment or prevention of intimal hyperplasia or restences caused by acute (e.g. mechanical) injury, deep vein thrombosis, pulmonary embolism, stroke, disseminated intravascular coagulation; fibrin deposition
                                                                                                                                      Factor VII, modified, Ser344Ala mutant; vascular patency, prevention, myocardial injury, blood flow; angioplasty; trauma; intimal hyperplasia; restencesis; deep vein thrombosis; treatment; pulmonary embolism; stroke; disseminated intravascular coagulation; fibrin deposition; endotoxaemia; myocardial infarction; anticoagulant; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      factor VII - also used to maintain vascular patency, prevent myocardial injury and improve regional myocardial blood flow.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1946 IGTGCATATCTCTATGTGCGTGTGCATCGGTGTGTTTTGCGTATCTCTGTGTGACCATCTG

The present invention describes a method for the inhibition or minimisation of myocardial injury associated with post-ischaemic repertusion by administering factor VII, which has at least I modification in its catalytic triad (therefore inhibiting the ability of factor VII to activate plasma factor X or IX). The method can be used for inhibiting or minimising myocardial injury and for imparting regional myocardial blood flow associated with post-ischaemic reperfusion. It can also be used for inhibiting blood coagulation, platelet deposition, thrombus formation and maintaining or improving vascular potency. Factor VII can be administered at relatively low doses and does not produce undesirable side effects. Further it acts specifically at sites of injury. The present sequence encodes Factor VII
                                                                                                                                                                                                                                                                    Factor VII, catalytic active site, blood coagulation, plasma, Factor X; Factor IX; vasotropic, antischaemic, anticoagulant, myccardial injury, post-ischaemic reperfusion, platelet deposition; thrombus formation; vascular potency; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Inhibition or minimization of myocardíal injury associated with post-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match 2.1%; Score 43; DB 1; Length 2422; Best Local Similarity 58.0%; Pred.                                                 Use of modified human factor VIIa with a covalent modification in its catalytic center, to inhibit thrombus formation or to maintain vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to the use of modified human Factor VIIa for inhibiting thrombs formation, or maintaining or improving vascular patency in a patient. The modified factor VIIa comprises a covalent modification in its catalytic center which effectively interrupts the blood cosquiation cascade. The modifications render Factor VIIa substantially unable to activate plasma factor IX or X. The modified Factor IX or X. The modified
                                                                                                                                                                                                                                                                                       Factor VIIa, thrombus, vascular patency, blood coagulation, Factor X, plasma factor, Factor IX, myocardial injury, human, Factor VII, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rasmussen ME;

The present invention describes novel human proteins, designated NOVX proteins. The NOVX sequences have cardiant, antiarteriosclerotic, proteins. The NOVX sequences have cardiant, antiarteriosclerotic, hypotensive, vasotropic, dermacological, anorectic, immunosuppressive, cytostatic, antiinfertility, haemaclogical, anorectic, immunosuppressive, cytostatic, antiinfertility, haemaclogical, anorectic, immunosuppressive, cytostatic, antiinfertility, haemaclogical, anorectic, inductor an expension as thereby and can be used in gene therapy. The NoVX sequences can be used with NoVX. The NoVX proteins and nucleic acids pathology associated with NoVX sequences, including cardiomyopathy, conditions associated with NoVX sequences, including cardiomyopathy, conditions associated with NoVX sequences, including cardiomyopathy, stenosis, scleroderma, obesity, metabolic disturbances associated with Compenital adrenal hyperplasia, prostate cancer, diabetes, metabolic discorders, neoplasm, adenocarcinoma, fertility, haemophilia, graft versus host disease, AlDS, corportial asthma, crofn's disease, multiple sclerosis, infectious disease, anorexia, neurodegenerative disorders (e.g. Alzheimer's disease, compenied proteins can also be used as immunogens to produce antibodies and as vaccines. The sequences may further be used in chromosome mapping, and in forensic identification of a biological sample. The present typing), and in forensic identification of a biological sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             952 TGTTGAGAATTATCAATGAGCAGTGTTTGTGGATTCTTGTTATCTTGCACTTGTGAAGTG 1011

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes a coagulation factor. The specification which comprises a binding region which binds to vasculature, particularly of tumours, and a tissue factor construct. The binding ligands can be used for stimulating coagulation in disease-associated vasculature, particularly for the treatment of tumours. The products can also be used for treating e.g. benign prostation hyperplasia, diabetic-retinopathy, vascular restenosis, arteriovenous malformations (AWM), meningioma, neovascular glaucoma, psoriasis, symovitis, dermatitis, endometriosis, angiotibroma, rheumatoid arthritis, atheroscelotic plaques, corneal graft neovascularisation, haramophilic joints, hypertrophic scars, OSEL-Meber syndrome, pyoganic aranuloma retrolental fibroplasia, scleroderma, trachoma, or vascular adhesions. The products can also be used in binding assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            952 TGTTGAGAATTATCAATGAGCAGTGTTTGTGGATTCTTGTTATCTTGCACTTGTGAAGTG 1011

```
The invention relates to the induction of blood coagulation specifically within tumour vasculature. This is achieved by the use of a bispecific molecule, which comparises a region capable of binding to intratumoral vascular or stromal celle linked to a coagulation factor or to a region capable of binding to a coagulation factor. An example of such a region capable of binding to a coagulation factor. An example of such a tumour antigen, and the other arm binds a coagulation factor. The capable of certain proteins (tumour antigens) is upreplated in tumour vasculature; such proteins (tumour antigens) is upreplated in tumour vasculature; such proteins (tumour antigens) is upreplated in tumour vasculature. The capable for bispecific molecule in order to target coagulation to the bispecific molecule in order to target coagulation to the uncorporated into the bispecific molecule in order to target coagulation to to tumour vasculature. The coagulation factor-binding portion of the bispecific molecule in order to target coagulation to the invention is a trundated form (tFF). A preferred form of TF used in the invention is a trundated form (tFF). A preferred form of TF used in the invention is a trundated form (tFF) an associated with a phospholipid surface for coagulation of cagniation to occur. However, associated with a phospholipid surface for coagulation to occur. However, and thinking of tFF to tumour vasculature via a tumour anticom/tFF bispecific anticody brings tFF into close enough proximity with the call membrane to cause benign growths, prostatic hypertrophy, restenosis, psortasis, but tumour vasculature, minimising side effects. Such kits are likely to be effective against many different types of cancer. Sequences AAAL2945- AAAL2954-AAL2954 and AAAL2971 AAL2972 represent Postpructs symmetry or the present invention to generate constructs in exemplifications of the present invention to generate constructs in the present invention to the present invention or tTF dimers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            952 TGTTGAGAATTATCAATGAGCAGTGTTTGTGGATTCTTGTTATCTTGCACTTGTGAAGTG 1011

This is the coding sequence for Factor VII/VIIa, a vitamin-K-dependent coagulation factor. This coagulation factor can be used in the formation of coagulation factor. This coagulation factor can be used in the formation of coagulations. The sequence can be used in the method for delivering a coagulation to a tumour-associated vasculature binding ligand consists of a binding region that binds to a surface.

Cell, intratumoural vasculature or tumour associated strong. The binding region is linked to a coagulation second binding region of an antibody. The method is used for cell, intratumoural vasculature or tumour associated strong. The binding region of an antibody. The method is used for an antigen binding region of an antibody. The method is used for an antigen binding region of an antibody. The method is used for associated vasculature which is benign or ampligant. The method can be used to treat cancer by promoting specific blood coagulation in the vasculature which is benign or malignant. The method can be used to treat tumour relative to the vasculature in nontumour sites. Vascularised tumours are usually solid tumours, particularly carcinomas which require a vascular component to provide oxygen and nutrients. The usual to treat benign and malignant diseases with a vascular restenosis, arteriovenous malignant, hasmangiona, heavenagine, necessariated agents such as activated plastis. Certain cells and disease-associated agents such as activated plastis. Certain disease-associated agents such as activated plastises and in different tumours, making it possible to treat numerous diseases and different types of cancer with one pharmaceutical, therefore an agent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vitamin-K-dependent coagulation factor; tumour associated vasculature, carcinoma; benign prostatic hyperplasia; diabetic retinopathy; vascular restenosis; arteriovenous malformation; meningoma; haemangioma; neovascular glaucoma; psoriacis; cytostatic; antidiabetic; vasotropic; ophthalmological; antipsoriatic; factor VII/VIIa; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bispecific binding ligands for promoting blood coagulation in a tumor associated vasculature are useful for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vitamin-K-dependent coagulation factor VII/VIIa coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 9; Col 127-130; 83pp; English.

polymucleotides are described which encode a propeptide fused to a nucleic acid sequence encoding a vitamin K-dependent protein (VKDP). The fusion proteins encoded are vitamin K-dependent protein gamma-carboxylation enhancers and are useful for optimising the gamma-carboxylation of a VKDP to produce a fully gamma-carboxylated VKDP. The fusion proteins and recombinant cells expressing them are useful for alleviating a VKDP associated disease. The fusion constructs result in the production of fully gamma-carboxylated mature VKDPs, which are biologically active. The invention encompasses all combinations of propeptide sequences (modified or not) and VKDP's. This sequence encodes the signal, propeptide and mature protein sequence of human Factor VII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tissue factor protein, truncated tissue factor; tTF; cytostatic; coagulant; diabetic retinopathy; arteriovenous malformation; meningioma; hemangiona; neovascular glaucoma; psoriasis; synovitis; endometriosis; hemophylic joint; hypertrophic scar; vascular adhesion; tumour; cancer; ligand; human; factor VII; ds.

The present invention relates to a binding ligand with a first binding region that is operatively linked to either a coagulation factor or a second binding region that binds to a coagulation factor. The first binding region is all or part of an antibody. An example of a coagulation factor for use in the invention is human truncated tissue factor for use in the invention is human truncated tissue factor for protein (see Abhl5019). The binding ligand of the mature tissue factor protein (see Abhl5019). The binding ligand of the mature tissue factor protein (see Abhl5019). The binding ligand of the mature tissue factor simulating coagulation in vasculature associated diseases. Particularly, the binding ligand is useful for treating both benign and malignant diseases that have a vascular component. These classes include benign growths (e.g. BPH), diabetic retinopathy, arteriovenous malformations, meningioma, hemangioma, neovascular coagulations, synovitis, endometriosis, hemophylic joints, hypertrophic scars or vascular adhesions. The present binding ligands of fer the advantage that even limited damage to the tumour vasculature could produce an avalanche of tumour cell death because each capillary provides oxygen and nutrients for thousands of tumour cells. The present condition factor VII/VIIa, This factor was

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent neoplastic activity, determining a chemical agent comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95 identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the channeal structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, concert to properties of the agent. All can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, concert to minimize the cancer, adenocardinoma, carcinoma, cancer, squamous call carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Endress G, Horrigan S;

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumouur in a patient, and differentiating metastatic liver cancer from hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABN93503-ABN97455 in a tissue sample. The method of the invention has hepatocropic, and cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic liver carcinoma in a patient. The method is useful for identifying the progression profiles which serve as useful diagnostic markers as well as markers that can be used to monitor disease states, disease progression, drug toxicity, drug efficacy and drug metabolism. Note: The sequence data obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in a liver tissue sample.

It is used in a DNA construct which contains a nuclectide sequence encoding a protein which, on activation, has the same biological activity for blood coagulation as Peator Ila. The nucleotide codes at least partially for Factor VII and comprises sequence encoding a calcium binding domain joined to a sceond sequence downstream of this encoding a catalytic domain for the serine proteins activity of Factor VIII. The calcium binding domain comprises a gene encoding Factor VIII. TX, Protein C, prothrombin or Protein S. The construct is used to transfect Nots cells to produce the protein which, on activation, yields Factor VIII. (Updated on 31-oCT-2002 to add missing OS field.) (Updated on 25-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The partial factor VII cDNA sequence is from cDNA clonl lambda VII2463.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gray CL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DNA construct used to transfect hosts - to produce protein which activates to give factor VIIa.

AAN60064/c
```

```
The partial factor VII cDNA sequence is produced by joining portions of cDNA clones lambda VII2115 and lambda VII1923. It is used in a DNA construct which contains a nucleotide sequence encoding a protein which, on activation, has the same biological activity for blood coagulation as Factor IIa. The nucleotide codes at least partially for Factor VII and comprises a sequence encoding a calcium binding domain joined to a scend sequence downstream of this encoding a catalytic domain for the serine protease activity of Factor VIIa. The calcium binding domain comprises a gene encoding Factor VII, IX, X, Protein C, prothrombin or Protein S. The construct is used to transfect host cells to produce the protein which, on activation, yields Factor VIIa. (Updated on 31-OCL2 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1755 drenecenecarrecenterecenecerecenenenararerenenenenenenenenenen

It is used to express construct which contains a nuclectide sequence encoding a protein which contains a nuclectide sequence encoding a protein which, on activation, has the same biological activity for blood cogquiation as Factor IIa. The nucleotide codes at least partially for Factor VII and comprises a sequence encoding a calcum binding domain joined to a scend protease activity of Factor VIIa. The calcum binding domain comprises a gene encoding Factor VIIa. The calcum binding domain comprises a gene encoding Factor VII. IX, X, Protein C, prothrombin or Protein S. The construct is used to transfect host cells to produce the protein which, on activation, yields Factor VIIa. (Updated on 31-0CT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gray CL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA construct used to transfect hosts - to produce protein which
